Bug Report: Documented Project Examples Rejected

Bug ID: PROJ-004

Summary: The documented example JSON and XML project inputs are rejected with 400.

Description:

The documentation at `/docs` gives an "Example JSON Input to API calls" for a project in which `completed` and `active` are strings (`"false"`, `"true"`), and an "Example XML Input" that contains `<id>null</id>`. Sending either example to POST `/projects` fails. The API only accepts real JSON booleans and rejects any body that carries an id.

Potential impact:

A developer who copies the documented example cannot create a project and has to guess the accepted format. The API also returns booleans as strings, so a client cannot send back what it just received.

Steps to reproduce:

1. Send POST `/projects` with `{"title":"a qui officia deseru","completed":"false","active":"true","description":"t in voluptate velit"}`.
2. Send POST `/projects` with Content-Type `application/xml` and the documented XML example, including `<id>null</id>`.

Expected result: 201 for both requests.

Actual result: 400 "Failed Validation: completed should be BOOLEAN, active should be BOOLEAN" for the JSON example and 400 "Invalid Creation: Failed Validation: Not allowed to create with id" for the XML example.

Found in: Projects session; curl commands in `Exploratory testing scripts/Projects/projects_session.sh`, section "Behavior that differs from the documentation".

Unit tests: `postAcceptsTheDocumentedJsonExample`, `postAcceptsTheDocumentedXmlExample` (expected), `postRejectsTheDocumentedJsonExample`, `postRejectsTheDocumentedXmlExample` (actual). Expected tests are in `ProjectsDocumentedBehaviorTest`; actual tests are in `ProjectsActualBehaviorTest`.
