Bug Report: POST vs PUT Category Update

Bug ID: CAT-001

Summary: POST preserves existing category descriptions when updating only the title, while PUT clears them.

Description:
The documentation describes POST and PUT /categories/:id identically as amending a category using the fields provided in the request body. However, POST preserves an omitted description, whereas PUT clears it.

Potential impact:
Clients using PUT to update only selected category fields may unintentionally lose existing descriptions.

Steps to reproduce:

1. Create a category with a title and a description.
2. Send a POST request to `/categories/:id` containing only an updated title.
3. Observe that the original description is preserved.
4. Restore the original category.
5. Send a PUT request to `/categories/:id` containing only an updated title.
6. Observe that the description is cleared.

Expected result: Both methods update only the specified fields and preserve all other existing fields.

Actual result: POST updates the title while preserving the existing description; PUT updates the title but clears the existing description.
