Bug Report: Malformed Payload Content-Type

Bug ID: TODO-006

Summary: Malformed JSON/XML errors are sent with Content-Type text/html

Description:

When POST `/todos` receives a malformed JSON or XML body, the API correctly answers 400 Bad Request with a JSON error body, but labels the response `Content-Type: text/html;charset=utf-8` instead of application/json. The JSON error message also exposes the internal parser class.

Potential impact:

Clients that choose a parser from the Content-Type header cannot read the error, and the message leaks implementation details.

Steps to reproduce:

1. Send POST `/todos` with header `Content-Type: application/json` and body `{"title":"Broken` (unterminated string).
2. Send POST `/todos` with header `Content-Type: application/xml` and body `<todo><title>Broken</todo>`.

Expected result: 400 Bad Request with `Content-Type: application/json` and an error message without internal details.

Actual result: 400 Bad Request with `Content-Type: text/html;charset=utf-8`; the JSON case returns `com.google.gson.stream.MalformedJsonException: Unterminated string at line 1 column 17`.

Found in: Session 1, probes S1-20 and S1-21 (session1_log.txt).

Unit tests: TodosMalformedJsonTest: "[Expected, fails] the error for malformed JSON is labelled as JSON" and "[Actual] the error for malformed JSON is labelled text/html".
